

Summary

Gudyk A.V. Heat transfer in boiling slag pellets in the liquid phase recovery. Diploma practice to the educational qualification of Bachelor, which takes place after the end of the full theoretical course. Using oxide materials for smelting alloys effectively enough, as it allows to attract scarce and expensive alloying elements. The melting of these materials, whatever the method, it is not carried out, - a set of separate processes. Spend a literature review of the well-known literature on the subject, the technique of heat exchange process between research. Research coal-ore pellets and boiling slag.
